

The Fuman Manifesto

Companion Note: Status, Intent, and Diagnostic Use

Status

The Fuman Manifesto is a satirical thought experiment, not a standard, policy document, product specification, or FERZ offering. It is not intended for implementation. No human-avian integration programs exist, are planned, or are endorsed by FERZ, Inc.

The document deliberately reproduces familiar features of governance frameworks: metrics, thresholds, taxonomies, audit requirements, incident analysis, stakeholder processes, and compliance architecture. Its structural completeness is intentional and central to its purpose.

Intent

The Manifesto is a diagnostic lens for evaluating governance frameworks, particularly in AI and machine learning. It demonstrates that governance form can be perfected independently of governance function.

The core question is: **What distinguishes a governance framework that constrains real execution from one that merely documents its own operation?**

Why Satire?

Satire separates structural analysis from domain-specific argument. The fictional subject matter allows readers to examine a framework's internal mechanics without first accepting its substantive premises.

The result is a closed-loop governance system. Its terms largely validate other terms inside the same framework. It can achieve internal consistency while providing no external operational authority.

Intended Use

- **Pedagogy:** Teach governance architecture, incident analysis, and compliance structure using a domain that requires no prior expertise.
- **Calibration:** Compare real governance frameworks against the Manifesto to identify internally complete but operationally hollow elements.
- **Commentary:** Examine whether governance requirements constrain execution or merely make execution observable after the fact.

Three Tests the Manifesto Fails

1. Grounding Test

Do the framework's terms and measurements connect to states of the world that exist independently of the framework? CAST is precisely specified, but it measures a fictional construct using fictional inputs.

2. Authorization Boundary Test

Must every effect-bearing action cross a fail-closed, pre-execution authorization boundary before release? The Manifesto contains warnings, declarations, licenses, and audit duties, but no non-bypassable authorization boundary.

3. Reconstruction Test

Does an authorization artifact allow an independent party to reconstruct the verdict from the governed inputs, policy state, authority state, and recorded outcome without access to the governed system? The Manifesto produces extensive logs, but no independently reconstructable authorization verdict.

Observability Versus Authorization

The Manifesto's First Axiom states that governance creates traceability. That statement is intentionally incomplete. A record of execution may explain what happened without establishing that the action was permitted before it happened.

For serious governance, traceability remains necessary but insufficient. An effect-bearing action must be evaluated before execution; failure to complete authorization must block release; and the verdict must be recorded in an independently reconstructable authorization artifact.
